

Anchors

Anchors are the unsung heroes of any fall protection system—they're the secure connection point that holds everything together. But not all anchors are created equal. From rooftops to rebar, anchorage connectors come in all shapes and sizes depending on the job, structure, and setup. To do their job right, they need to be rated for fall arrest and strong enough to handle the load with a solid safety factor.

Is your anchor ready to do its job?

Let Ritz Safety help you upgrade to something safer, stronger, and built to keep you protected.

Body Support

A full body harness is designed to distribute fall forces across the thighs, pelvis, chest, and shoulders, helping protect the worker during a fall arrest.

Choosing the right harness matters.

From construction sites to confined spaces, make sure your crew is equipped with harnesses built for the demands of their environment. Comfort, proper fit, and compliance with local, state, and federal standards aren't just nice-to-haves... they're essentials.

Connectors

Connectors like shock-absorbing lanyards and self-retracting lifelines are the critical link between your harness and your anchor point. They're what tie your fall protection system together—and your safety depends on them doing their job right.

Descent & Rescue

Descent and rescue devices are built to raise, lower, or retrieve a worker after a fall—or pull them out of a confined space. When the unexpected happens, time matters. Fast, safe recovery isn't just a nice idea—it's a must.
